

Visma EasyCruit release notes

May 2023

Automated cancelling of team review after rejection

Purpose and scope

We've automated stopping and cancelling of team reviews when a candidate is rejected.

Description

When you reject a candidate that's also been shared for team review, all pending reviews are cancelled and all completed reviews are stopped. This means that the candidate will disappear from the team review platform overview of the reviewers. This automation makes sure that the team review platform is cleaned up without any additional administrative actions that have to be taken.

Workflow

1. Reject candidate(s).
2. Pending and completed team reviews are cancelled/stopped.
3. Team review platform overview of the concerned reviewers doesn't show the rejected candidate(s) anymore.

Transfer candidate improvement

Purpose and scope

We've improved the transfer candidate page by adding reference numbers in the dropdown as well as making the dropdown searchable.

Description

When you transfer a candidate, you have to select the vacancy that the candidate needs to be transferred to. This is done in a new dropdown which combines the vacancy titles and the reference numbers. In this way you can distinguish between vacancies with the same vacancy title. Next to this it's also possible to search within the dropdown, both on vacancy title and reference number. In this way you don't have to scroll through a huge list of vacancies.

Workflow

1. Select candidate(s).
 2. Choose action 'Transfer to another project' in order to transfer the candidate(s).
 3. Choose the concerned vacancy from the dropdown through the improved search.
 4. Candidate(s) is/are transferred.
-

Restore vacancies by vacancy owner

Purpose and scope

Vacancy owners are now able to restore their vacancies when the concerned ACL has been activated in client settings.

Description

Clients can now choose to activate the ACL for restoring vacancies by vacancy owners. This will give vacancy owners the option to restore vacancies themselves, so admins don't have to do this anymore and therefore reduce their administrative workload.

Workflow

1. Activate ACL for restoring vacancies by vacancy owner (by consultant).
2. Now vacancy owners are able to restore vacancies.
